Mercury, the structure of the planet Using the spacecraft 'Mariner 10', astronomers managed to find a weak atmosphere in Mercury.. In the atmosphere of the planet, in addition to Helium, scientists managed to find an insignificantly small concentration of hydrogen.

But the content of this element in the atmosphere is about 50 times smaller than Helium.. It ranges in brightness from about -2 0 to 5 5 in apparent magnitude, but is not easily seen; its greatest angular separation from the Sun (greatest elongation) is only 28.

In March 1974, 'Mariner 10' approached Mercury, and in a few days, scientists had a unique opportunity to learn about this mysterious planet more than for the entire previous history of mankind.. The atmosphere of Mercury is extremely rarefied, and at the surface of the planet, the pressure is 500 times less than the average pressure at the surface of the earth.. Close to the sun, the location of the planet, high temperature fluctuations, and a small mass, and consequently gravity, led to the loss of this primary atmosphere by this planet.. Under such conditions, more detailed information about this planet can be obtained only through studies with the help of unmanned spacecraft. [Mac Spark Email Microsoft Exchange](#)

[Quanta 30ea 86.09 Motherboard Support Drivers](#)

Like its fellow terrestrial planets, Mercury has a central core, a rocky mantle and a solid crust.. Mercury is the innermost and smallest planet in the solar system, orbiting the Sun once every 88 days.. A dozen times over the site, it happens that Mercury passes through its orbit directly between the Sun and Earth, at this moment, observers from the ground can observe against the background of the solar surface a small spot.. Studies of the planet with the help of spacecraft, found the fact that the planet like the earth and other planets of the terrestrial group has a magnetic field, which gives reason to believe that in the interior of the planet there is an iron-nickel core. This fact is explained by the fact that Mercury has a reliable supplier of this element - the Sun, and Helium is delivered to the planet, in the form of a solar wind plasma.. In such cases, as a rule, the planets lose the lightest gases that make up its atmosphere, such as hydrogen and helium, but as it turned out, the main component of the atmosphere of Mercury is Helium.. The atmosphere of Mercury is like a current stream, in the sense that the planet constantly loses some of its atmosphere, and Helium flows into open space, but the solar wind continuously replenishes this shortage.. 3° (it can only be seen in twilight) Mercury formed about 4 5 billion years ago when gravity pulled swirling gas and dust together to form this small planet nearest the Sun.. Mercury Research Small size, and proximity to the sun, greatly complicates the possibilities of exploring this planet. ae05505a44 [Unduh Browser Gratis Harlequin Terjemahan Indonesia China Descargar](#)
